

The Use of Image Manipulation to Process Emotion and Improve Clinical and Patient Centered Outcomes for Individuals with Pain

Investigators:

Rachel P. Dreyer (Ph.D.), Mary A. Driscoll (Ph.D.), Cynthia Brandt (MD), Brian Coleman (DC), Luis Marenco (MD)

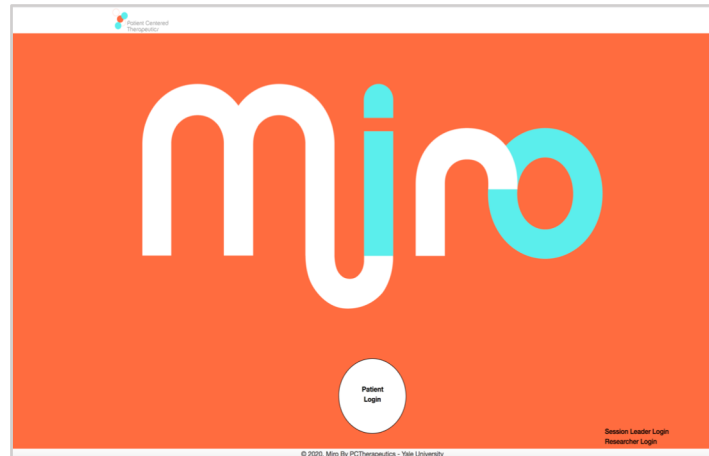

the problem

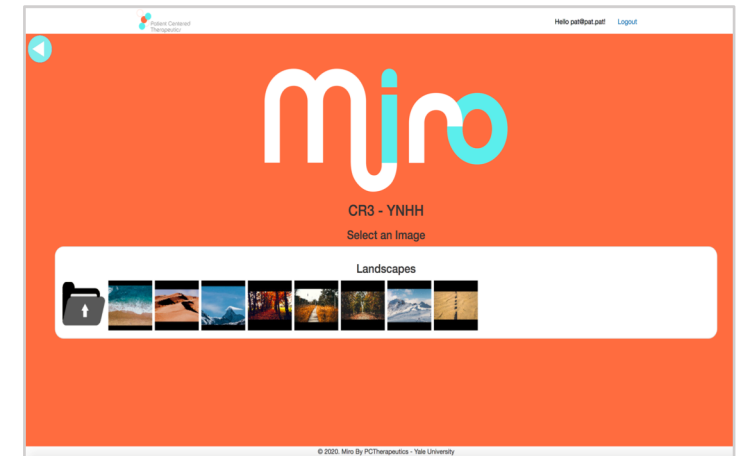

- ✓ High rates of alexithymia are associated with onset and maintenance of chronic pain
 - Inability to identify, express, describe or regulate feelings¹
- ✓ Alexithymia portends poorer pain outcomes and may do so via disruption of affective neural pathways, and its interaction with positive and negative affect^{1,2}
- ✓ The Gold standard for pain self-management is Cognitive Behavioral Therapy for Chronic Pain (CBT-CP)
 - Less effective for those high on emotional and interpersonal distress
 - Fails to address emotional distress
- ✓ Emotional Awareness and Expression Therapy (EAET) for Chronic Pain has been proposed as an alternative intervention
 - Preliminary trials suggest it outperforms CBT-CP on pain reduction
 - Logistical barriers limit availability/uptake
- ✓ Need for an effective, portable and scalable intervention that targets emotional processes

introducing
miro

✓ Miro™ is an innovative digital health application using image modification

Patient portal

Select an image

✓ The therapeutic image modification process used in Miro™ is based on existing clinical and research methods

✓ A new mechanism for individuals with chronic pain and trauma to communicate complex emotions and facilitate patient centered care

Modify an image

Once complete, save image

“You hardly ever hear anyone describe the pain [after a heart attack]... it’s such a weird pain. It’s not like when you cut your finger [kind of pain]...It’s just such a strange sensation. I have never heard it described, you know?...”

it’s a kind of pain that is just so out of control – and that I cannot ever describe in words.”

✓ Expression through images has been used in medicine for many years

- ✓ Therapeutic process
- ✓ Enables self-expression¹
- ✓ Enhanced recovery^{2,3}

1. Wang et al. Health Edu & Behav. 1997;24:369-387.

2. Cabassa et al. Psychist Serv. 2013;64(9).

3. Rajendran et al. Academic Emer Med. 2020;27:92-99.

✓ Emotion has been predicted from images⁴

- ✓ Artificial intelligence
- ✓ Advanced machine learning
- ✓ Convoluted neural networks

4. Chen et al. IEEE International Symposium on Multimedia (ISM). 2016: 367-368.

✓ Address barriers related to:

- ✓ Access to care
- ✓ Engagement in care
- ✓ Communication

✓ May improve:

- ✓ Patient outcomes
- ✓ Patient satisfaction

the industry

Total worldwide healthcare application vendors
top \$17.6 billion in 2016

- \$ Medical software and services market
- \$ Targeting multiple points of entry in the medical applications market
- \$ We can profit by providing a service to medical care organizations
- \$ Seek to provide new category of digital therapy
- \$ Used as a stand alone product or bundled with existing evidence based treatments
- \$ This includes hospitals, insurance companies or academic institutions

the competition

- Our competition is other software applications that are developed as a unimodal application suite
- Biobeats, Jvion, Affectiva, Beyond Verbal, nVISO
- These companies use artificial intelligence for facial recognition or voice pattern recognition for emotion prediction
- Using Miro in communicating emotions may improve outcomes and lower healthcare costs by reducing inpatient stays and hospital readmissions¹⁻³

Our differentiating benefits include a future novel platform and digital therapeutic capable of predicting various patient and clinical outcomes using image modification
